

Don't Build a Distributed Monolith

How to Avoid Doing Microservices Completely Wrong

Jonathan "J." Tower

Avoid the **10 Most Common**Mistakes Made When Building Microservices

Good vs Bad Monoliths

10 Most Common Mistakes

Avoid Creating a "Monster"

Assuming Microservices are Always Better

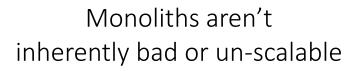

Problem #1

First Rule of Microservices: Don't Use Microservices

Have a "Really Good Reason" – Sam Newman

Microservices are *hard* to do well

Wrong reasons create distributed monoliths

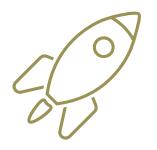

Some Good Reasons to Microservice

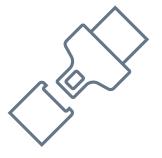

"Microservice architectures **buy** you **options**" – James Lewis

More Scalability
Options

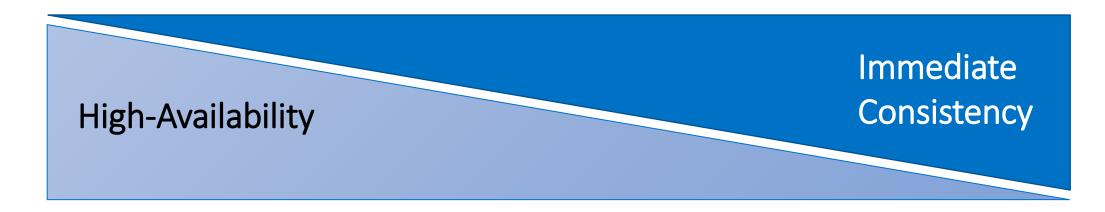

Independent Deployability

Isolate Surface Area of Failure

The Big Trade Off

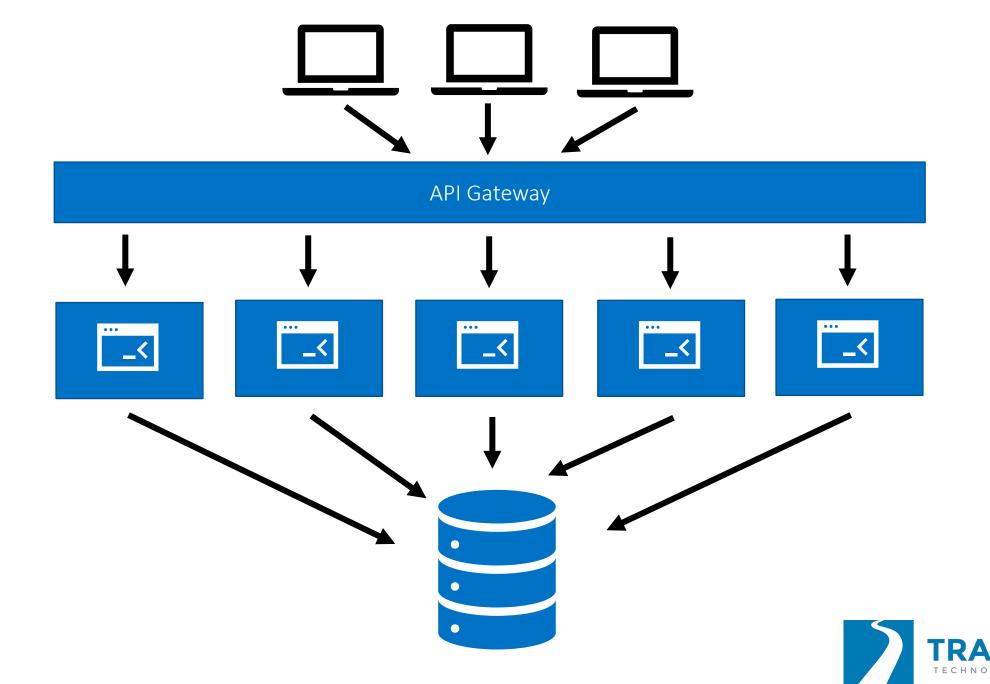

Microservices Monoliths

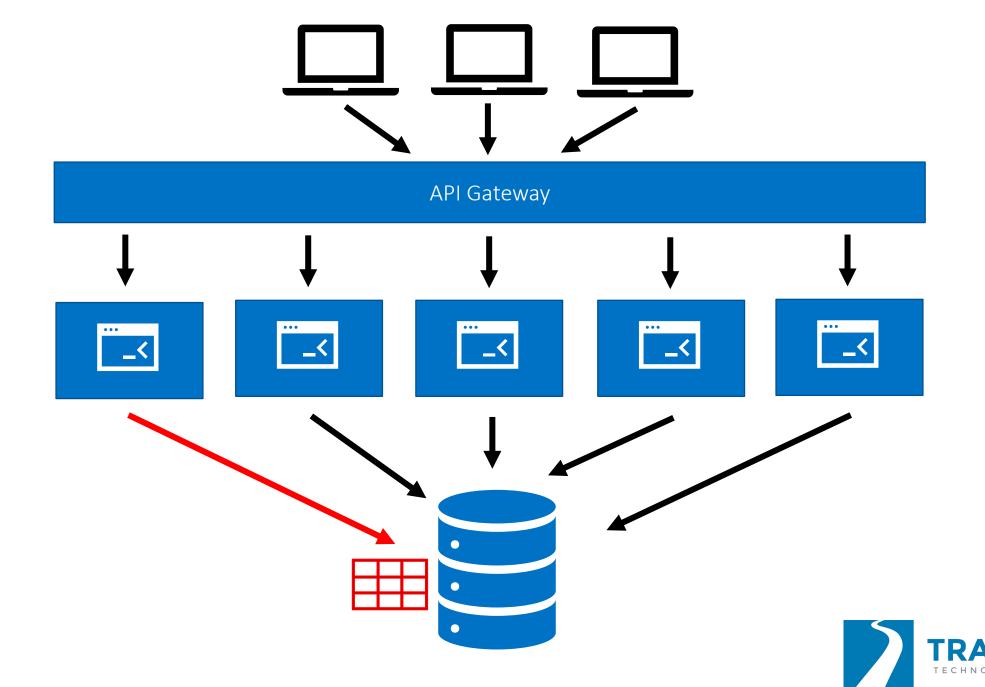

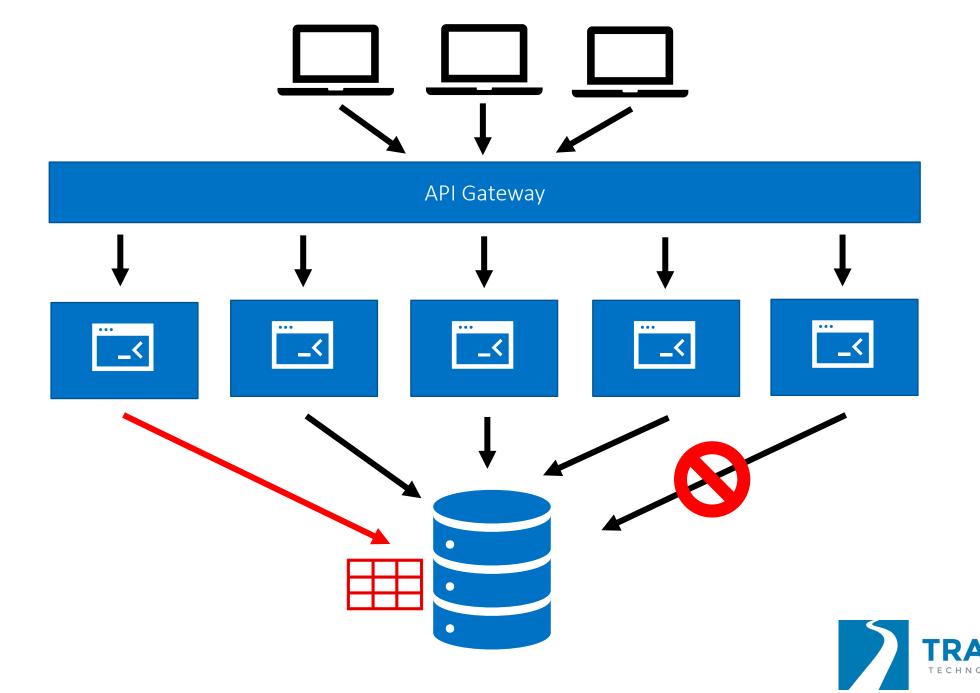

Shared Data Store or Models

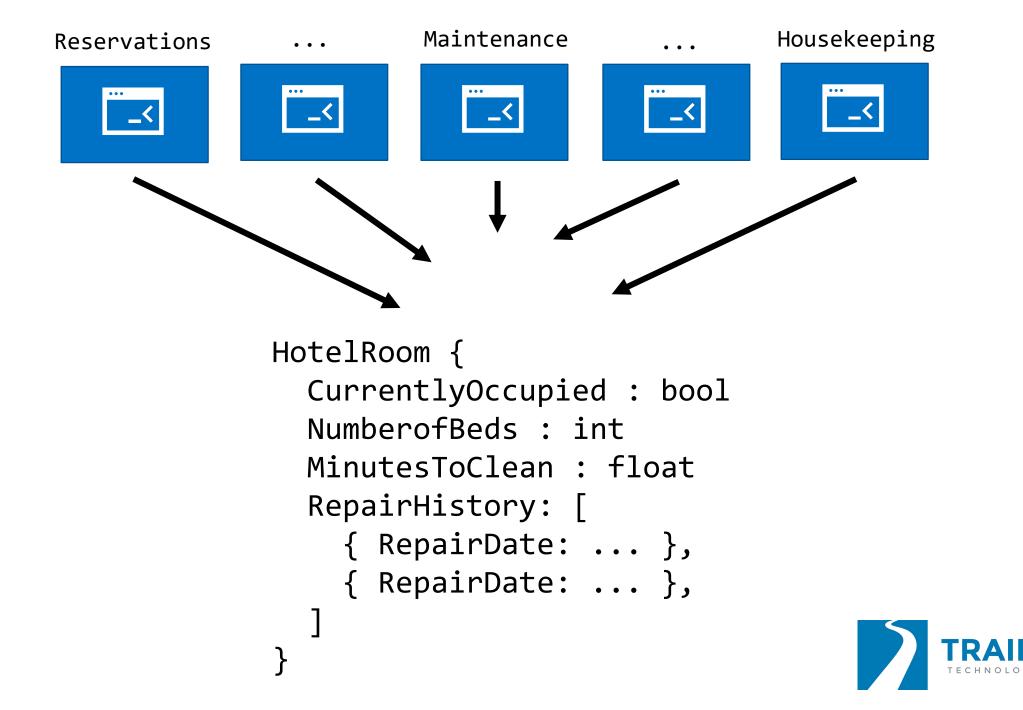

Problem #2

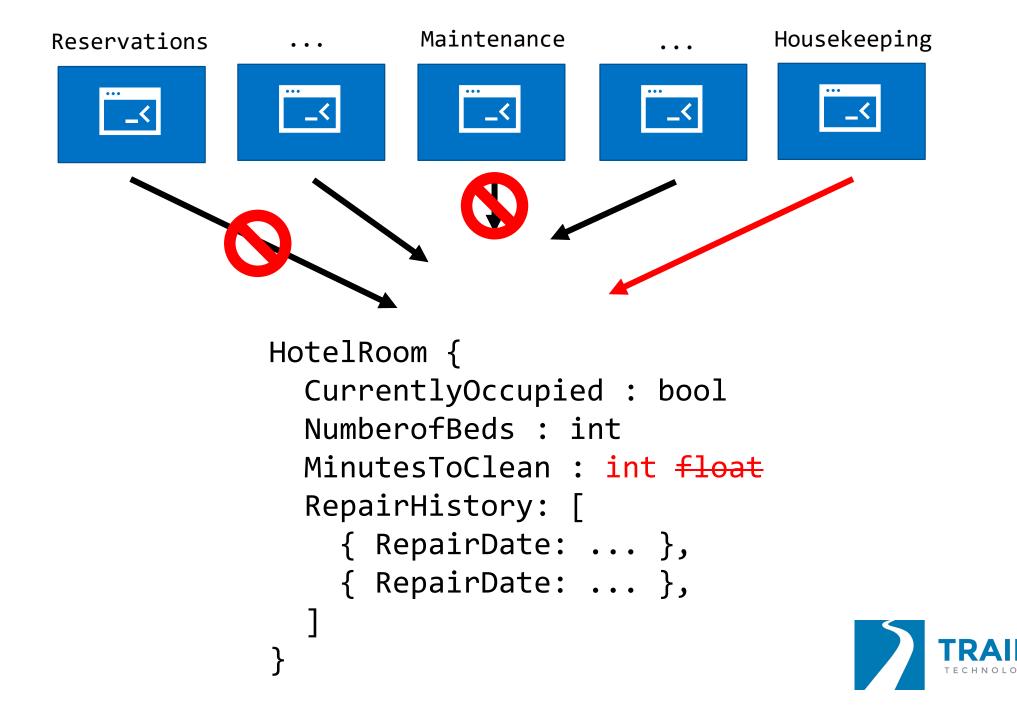

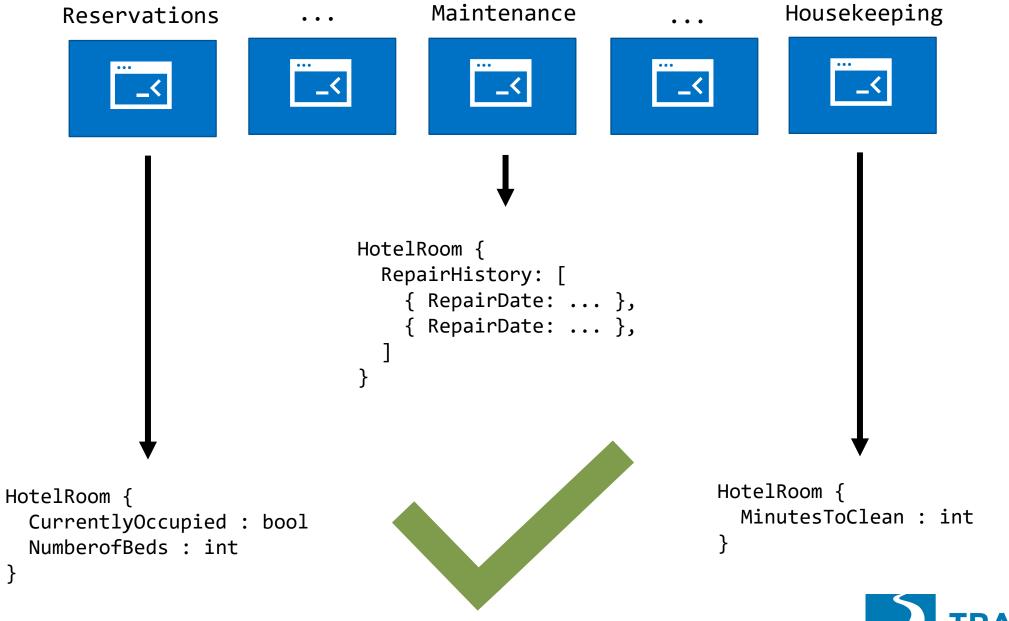

Reservations

. Housekeeping

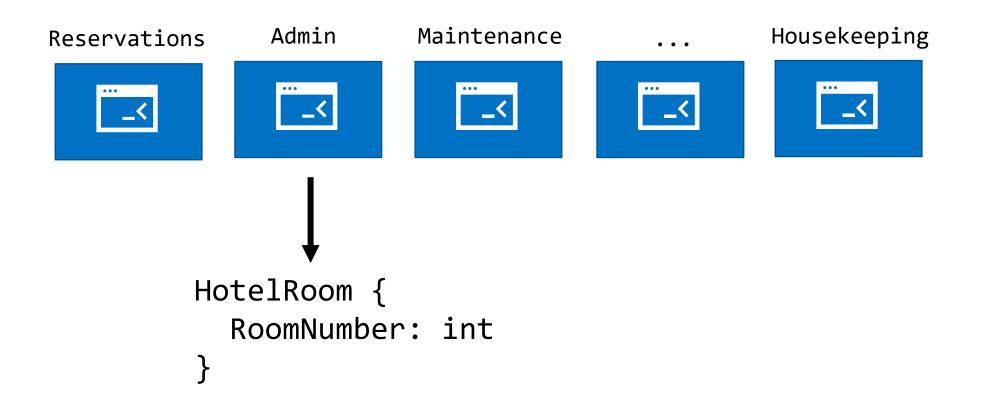

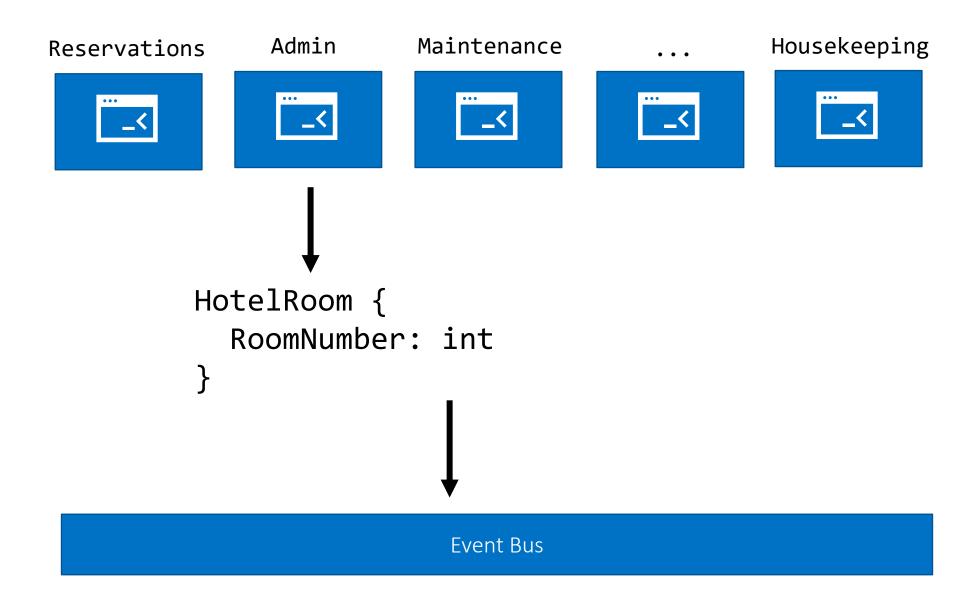

Event Bus

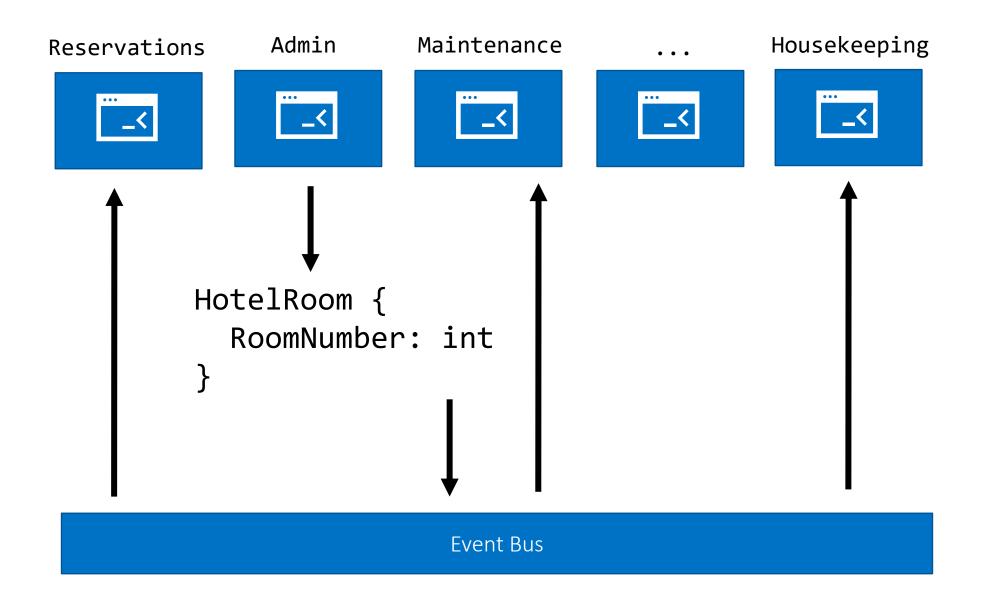

Event Bus

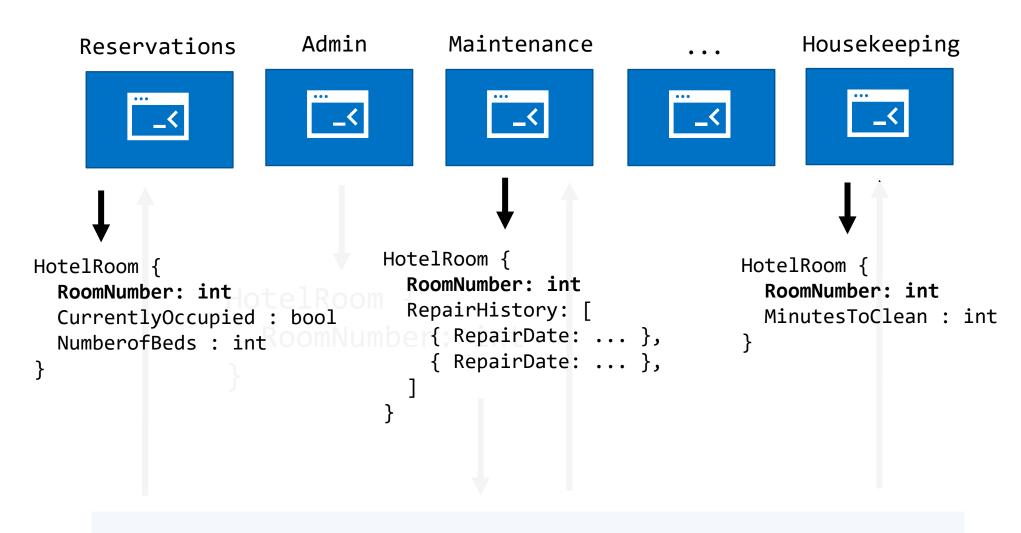

Event Bus

Microservices That Are Too Big

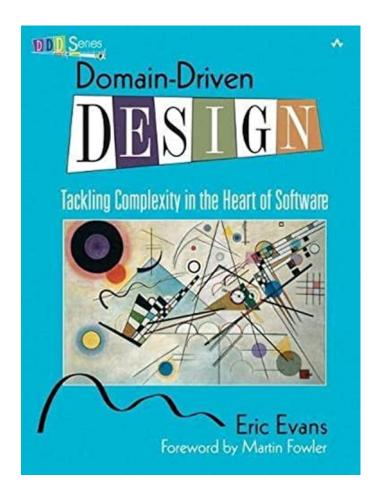

Domain Driven Design (DDD)

Domain
Subdomain
Bounded Context

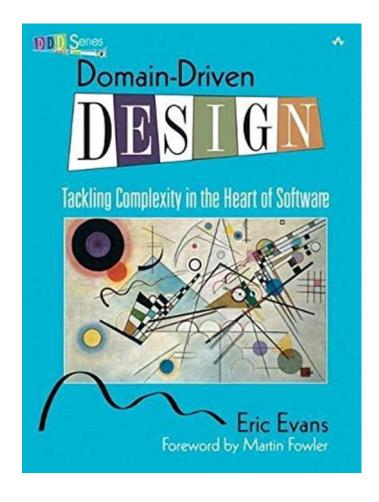

Domain Driven Design

Domain
Subdomain
Bounded Context

Domain Driven Design

Domain
Subdomain
Bounded Context

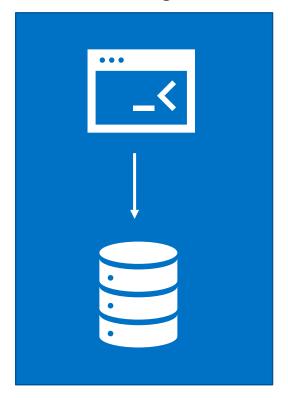

J's SIMPLE RULE: smallest possible microservices without chatty communication between services

Microservices That Are Too Small

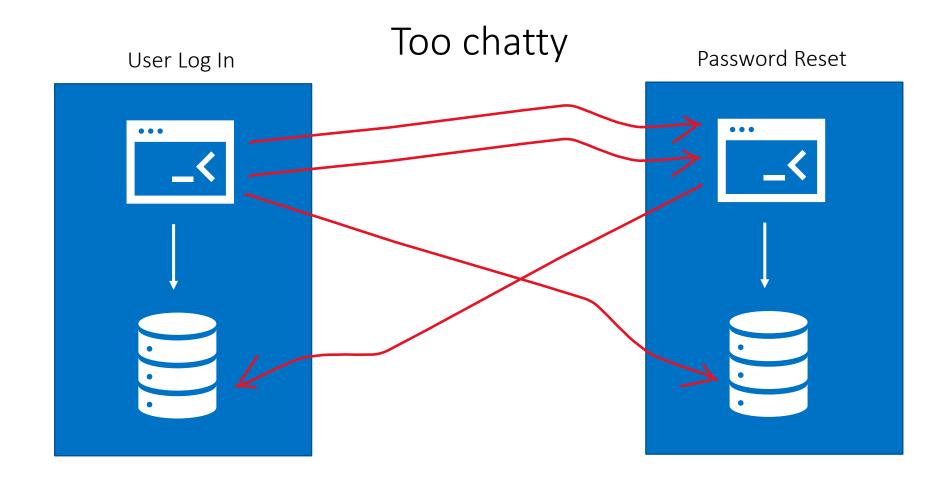

User Log In

Password Reset

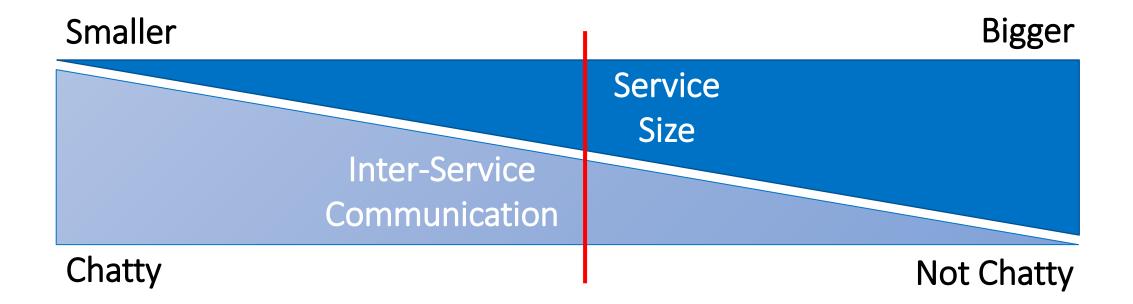

Balance

Starting from Scratch

Greenfield is Actually Harder

Easier to partition an existing, "brownfield" system

Brownfield → **Microservices Advantages**:

- 1. Code and relationships to examine
- 2. People to talk to who know the system
- 3. A system that already works
- 4. Baseline to compare to refactoring

Three "Brownfield" Migration Approaches

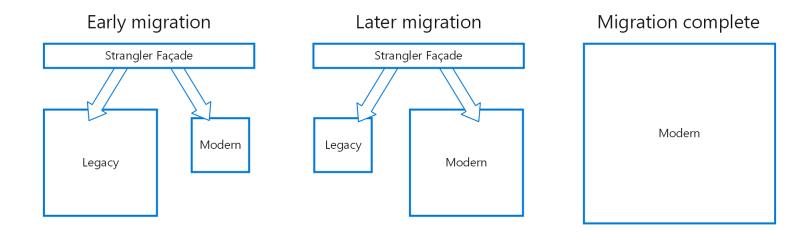

Big bang

Evolution

"Strangler fig" pattern

Strangler Fig Pattern

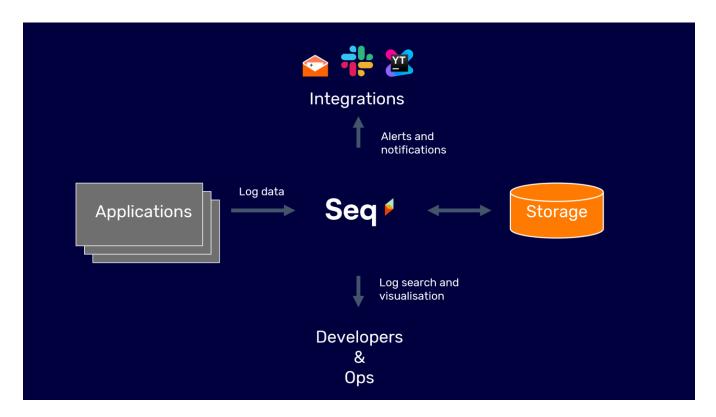

Coupling Through Cross-Cutting Concerns

Example: Distributed Logging Is Hard

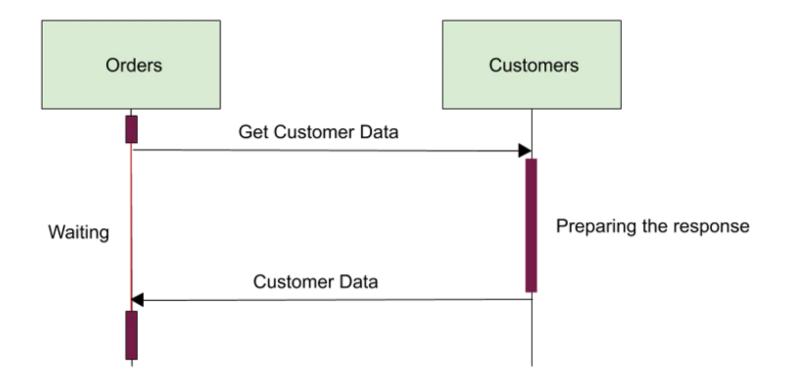

- Centralized without coupling
- Third party solutions like Seq
 - Seq: "Intelligent search, analysis, and alerting server built specifically for modern structured log data"
 - Supports .NET, Java, NodeJS, Ruby, Go, Python, more.
 - Inherently fault tolerant, embraces eventual consistency

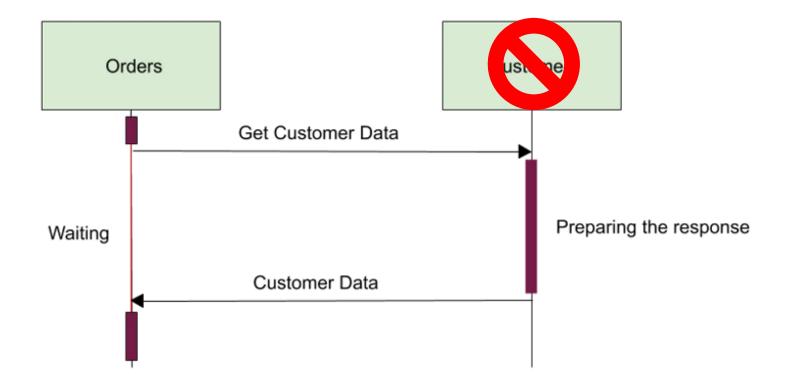

Use of Synchronous Communication

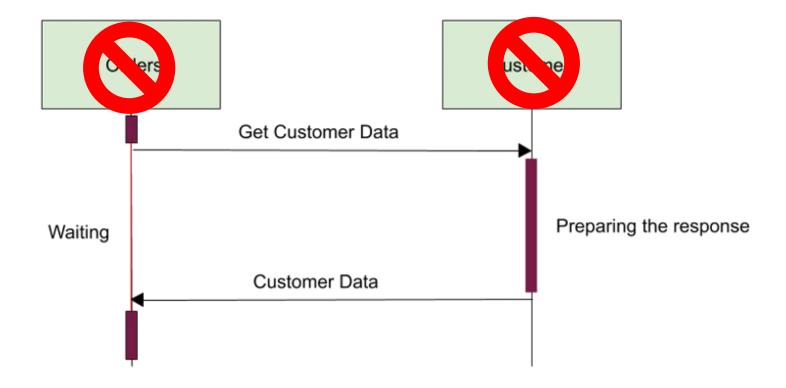

Alternatives to Synchronous Communications

Asynchronous Service Bus

Asynchronous Polling

Circuit breaker pattern

Alternatives to Synchronous Communications

Asynchronous Polling

Breaking Changes to Event Contracts

Rules for Event Changes

01

No new required fields, only optional fields (with documented default values).

02

Unrecognized fields are **ignored** (but forwarded)

03

Consumers of optional fields use default values when missing

04

When 1-3 cannot be satisfied, it's a **new event** type

Not Automating Build and Release

Prerequisite: Automated Build and Release

Time consuming

Prone to human error

Mismatched Teams

Conway's Law

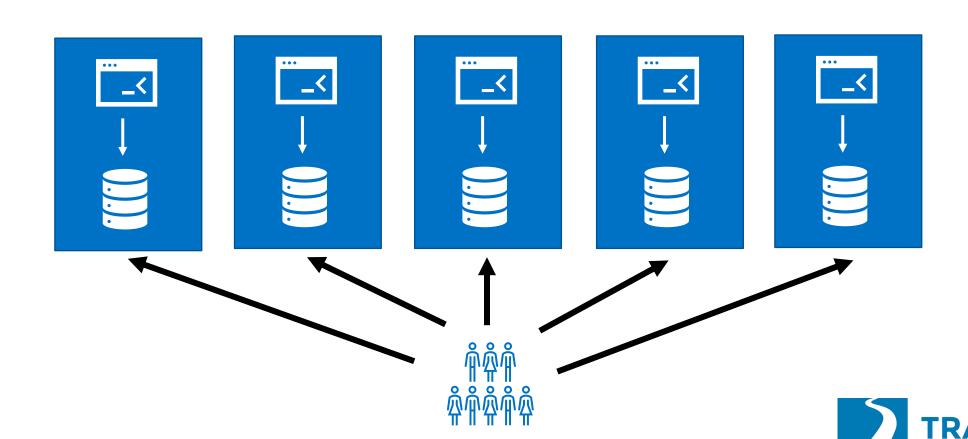

"Any organization that designs a system (defined broadly) will produce a design whose **structure** is a **copy** of the organization's **communication structure**."

- Melvin E. Conway

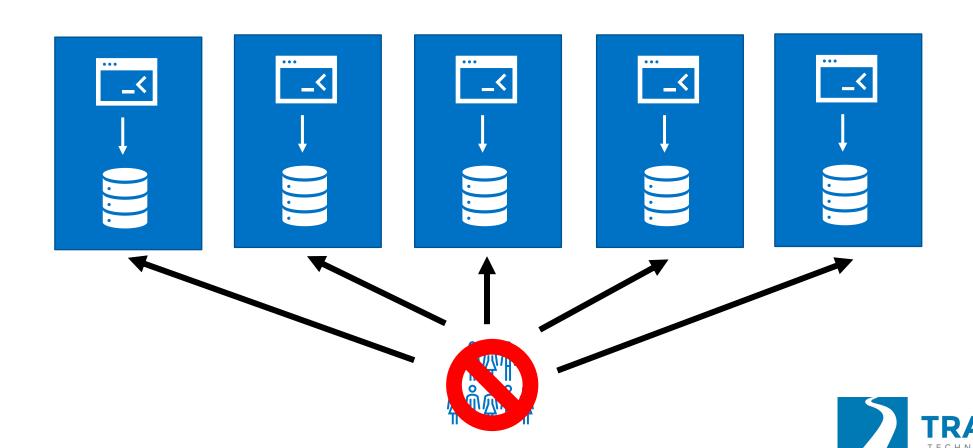

IOW: if you have four groups working on a compiler, you'll get a 4-pass compiler.

Single Team

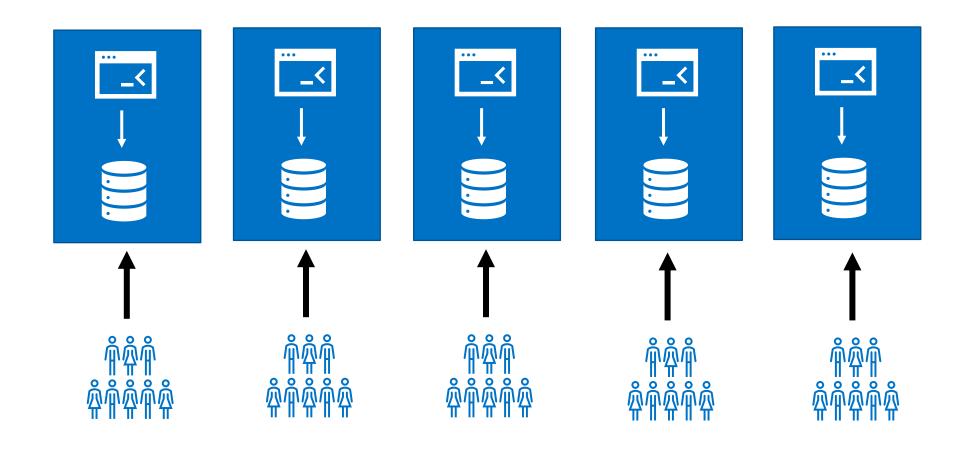

Single Team

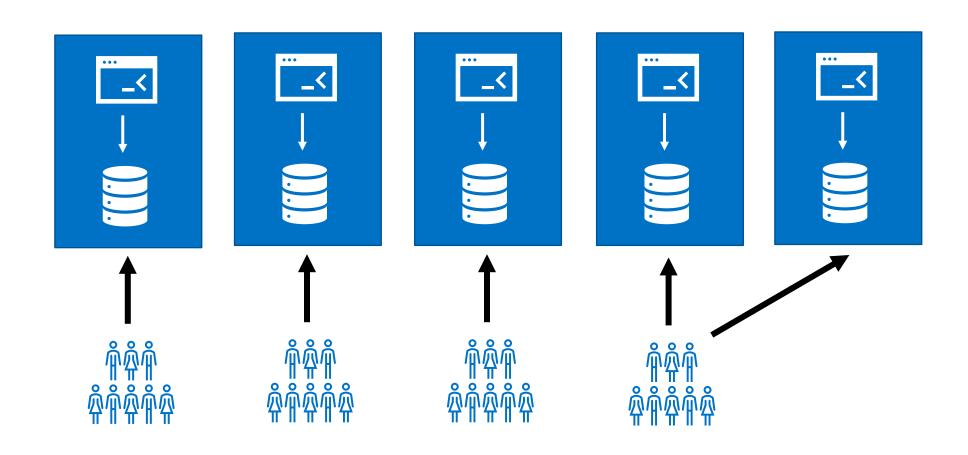

Team Per Service

Team Per Service

Summing Up

- 1. Monoliths can be good too!
- 2. Only use microservices with "a really good reason".
- 3. Consider starting with a monolith.
- 4. Monolith with a single team; microservices for separate teams.
- 5. When implementing microservices, avoid the 10 commons pitfalls leading to distributed monoliths.

Thanks! Questions?
